

Addendum: Dupixent® (dupilumab) showed positive results in two Phase 3 trials of patients with chronic rhinosinusitis with nasal polyps

October 16, 2018

Dupilumab development program

In addition to its approved indication in adults with uncontrolled moderate-to-severe atopic dermatitis, Regeneron and Sanofi are also studying dupilumab in a broad range of clinical development programs for diseases driven by allergic and other Type 2 inflammation, including asthma (under regulatory review), pediatric asthma (Phase 3), pediatric atopic dermatitis (Phase 3), adolescent atopic dermatitis (Phase 3), eosinophilic esophagitis (Phase 3), grass allergy (Phase 2) and peanut allergy (Phase 2). A future trial is planned for chronic obstructive pulmonary disease. Dupixent is also being studied in combination with REGN-3500, which targets IL-33. These potential uses are investigational and the safety and efficacy have not been evaluated by any regulatory authority.
